

Velora Multi-Vendor Guide

How It Works

Each vendor gets:

1. A **unique vendor ID** (e.g., velora-electronics, fashion-hub-lusaka)
2. Their own **dashboard** at vendor-dashboard.html (same file, different login)
3. Their own **store page** (same file, filtered by vendor_id)
4. Their **own orders** — only see orders for their products

Data Flow

```
Vendor uploads product → saved with vendor_id = 'their-vendor-id'
Customer adds to cart   → cart item includes vendor_id from product
Customer checks out     → order created with vendor_id from item
Vendor opens dashboard  → sees only orders with their vendor_id
```

Adding a New Vendor

Step 1: Add vendor to database

Run this in Supabase SQL Editor (modify for your vendor):

```
INSERT INTO vendors (id, name, email, phone, password_hash, location, category, verified, active)
VALUES (
  'fashion-hub-lusaka',
  'Fashion Hub Lusaka',
  'fashion@example.com',
  '26097222222',
  'their_password_here',
  'Lusaka, Zambia',
  'Fashion',
  true,
  true
);
```

Step 2: Vendor logs in

Vendor goes to vendor-dashboard.html and enters:

- **Vendor ID:** fashion-hub-lusaka
- **Password:** their_password_here

Step 3: Vendor uploads products

Products are automatically saved with vendor_id = 'fashion-hub-lusaka'

Step 4: Customer buys

Customer visits the store, adds a Fashion Hub product to cart. At checkout, the order is saved with vendor_id = 'fashion-hub-lusaka'.

Step 5: Vendor sees the order

Fashion Hub's dashboard shows the order. Velora Electronics does NOT see it.

Per-Vendor Store Pages

Currently the store page (`velora-electronics.html`) uses a hardcoded `VENDOR_ID`. To create a store for each vendor, either:

Option A: Single store page with vendor filter Add `?vendor=fashion-hub-lusaka` to the URL and read it in JavaScript.

Option B: Separate HTML files Copy `velora-electronics.html` and change `VENDOR_ID` for each vendor.

Important

- **Never change a `vendor_id` after creation** — it breaks all existing products and orders
- **Vendor IDs must be URL-safe** — use lowercase, hyphens, no spaces
- **Passwords should be hashed** — currently plain text for simplicity
- **The `velora-electronics` vendor is your default/first vendor**

Files That Handle `vendor_id`

File	How It Uses <code>vendor_id</code>
<code>vendor-dashboard.html</code>	<code>VENDOR_ID</code> from login → filters products, orders, messages
<code>velora-electronics.html</code>	<code>VENDOR_ID</code> constant → loads products for this vendor
<code>product-detail.html</code>	Reads from product → adds to cart with <code>vendor_id</code>
<code>cart.js</code>	Groups cart items by <code>vendor_id</code> → creates one order per vendor
<code>customer-dashboard.html</code>	Loads orders by customer phone/email
